Sparx Dialog/Form Creation Flowchart

- A. Define dialog in WEB-INF/ui/dialogs.xml (the "dialog component")
- B. Choose how you want to call the dialog (through a servlet, a JSP, or a templating engine)
- C. If you use the JSP call, all of the code is automatic -- you just used the <xaf:dialog> or <xaf:query-select-dialog>
- D. If you use the templating engine or Servlet model, you use factory methods and constructors and then use the following code:

```
2. sc = getservletcontext()
   mgr = DialogManagerFactory.getDialogManager(sc)
3. Dialog dialog = mgr.getDialog("package.name")
4. DialogContext dc = dialog.createContext(...)
   dialog.prepareContext(dc)
   if(dc.inExecuteMode())
      do_something()
   else
      dialog.getHtml(dc, true)
```
